

Nexiva Project Whitepaper

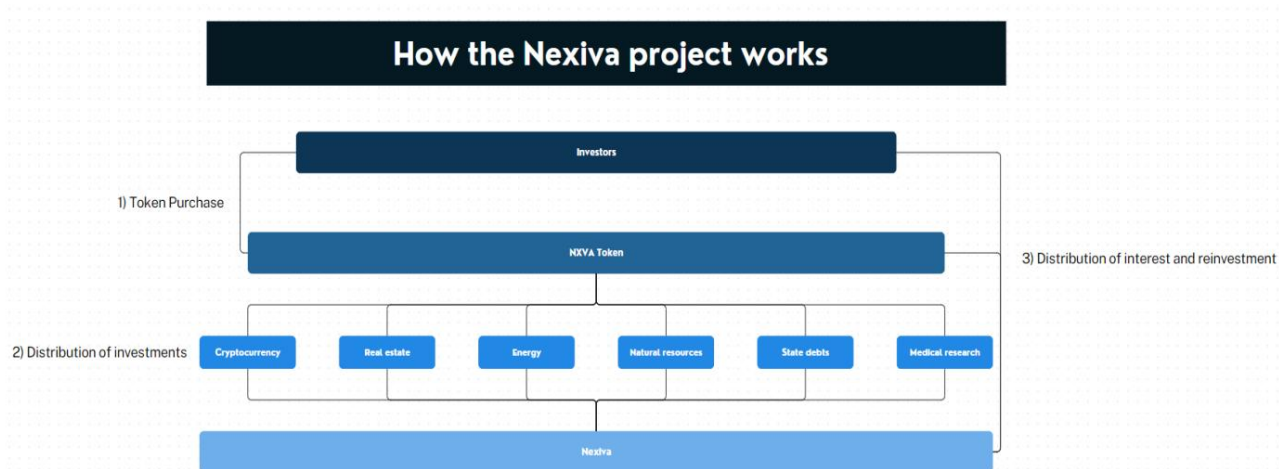

NEXIVA

1. Introduction

The Nexiva project is designed to democratize access to niche investment sectors, traditionally reserved for large investment firms, such as cryptocurrency, real estate, energy, natural resources, government debt and medical research.

The main objective is to allow all users to participate in a collective investment system within a community, in order to generate profits in a stable and secure manner. To do this, the method chosen is the creation of a token (NXVA).

2. System

The cryptocurrency market offers few options for investors seeking stability. NXVA addresses this need with a euro-pegged token, leveraging the Polygon blockchain for fast and low-cost transactions, and integrating the Chainlink oracle to ensure a real-time transparency of the value of the euro.

3. Allocation of funds

Nexiva Project funds are strategically distributed to ensure the security and growth of the project:

- **65%** allocated to investments in niche sectors.
- **20%** in liquidity to guarantee the stability of the token.
- **15%** intended for the growth and development of the project

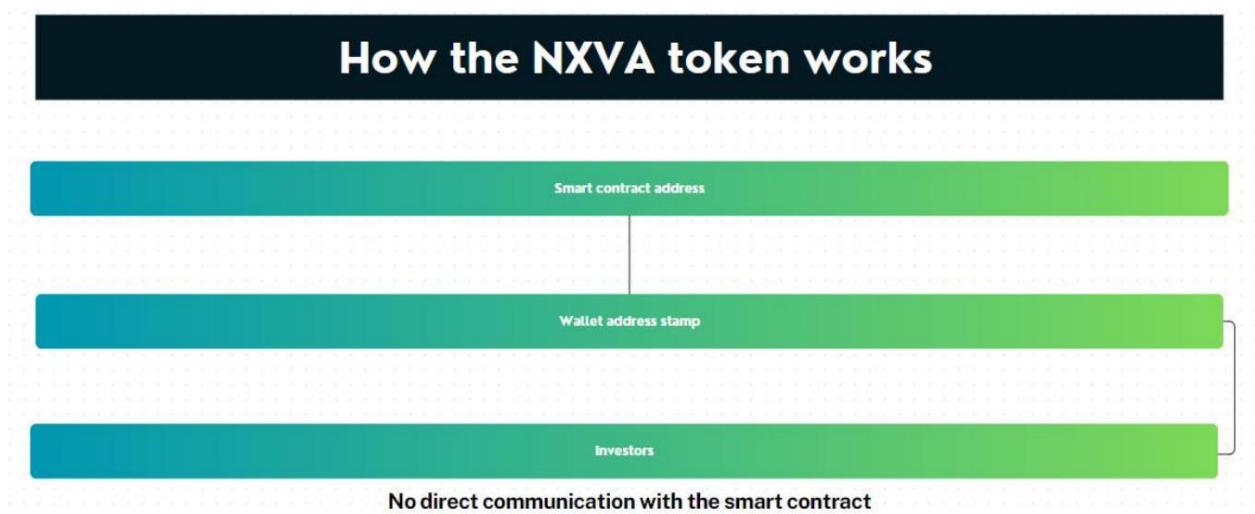

4. Technical operation and distribution of dividends

The NXVA token is based on two addresses:

- **Smart contract address** : It has full control over the management of the smart contract, buffer address and token, including creation (mint) and destruction (burn).
- **Buffer address** : Without authorization, it is only dedicated to distribution and token transfers with users. It can be replaced by the smart contract address if necessary.

For security reasons, all transactions with investors will be made only through the buffer address. Investors will receive dividends proportional to the holding period, thus encouraging them to keep their investments for the long term. These dividends are distributed in the form of additional tokens, calculated as a percentage of the amount already held.

5. Communication channels and marketing strategy

The project will be actively promoted through popular platforms such as Facebook, Instagram and X (Twitter), as well as on the official website. The team will regularly communicate updates to inform the community and attract new investors, while strengthening the transparency and credibility of the project.
